- The backend of the website is made using php and mySql Database through xampp.
- The website runs on xampp apache server

Pages of the website

- Home Page
- About
- Packages
- Booking

Website Pages

DATABASE

The screenshot displays the phpMyAdmin web interface. On the left is a sidebar with a tree view of databases: 'New', 'book_db', 'New', 'book_form', 'information_schema', 'mysql', 'performance_schema', 'phpmyadmin', and 'test'. The 'book_form' table is selected under the 'book_db' database.

The main panel shows the 'book_form' table structure. At the top, it indicates 'Showing rows 0 - 2 (3 total, Query took 0.0003 seconds)'. Below this is the SQL query: `SELECT * FROM `book_form``. There are links for 'Profiling', 'Edit rows', 'Edit', 'Explain SQL', 'Create PHP code', and 'Refresh'.

Below the query, there are controls for 'Show all', 'Number of rows' (set to 25), 'Filter rows' (a search box), and 'Sort by key' (set to None).

The table data is displayed in a grid. The columns are: name, email, phone, address, location, guests, arrivals, and leaving. There are two rows of data:

	name	email	phone	address	location	guests	arrivals	leaving	
☐	2	prabir	pa@gmail.com	67890	gthd	Kailash parvat	8	2022-11-25	2022-11-30
☐	3	Tamara	tamara@gmail.com	2147832647	Kolkata	Manali	4	2022-12-01	2022-11-29

Below the table, there are actions: 'Check all', 'With selected', 'Edit', 'Copy', 'Delete', and 'Export'.

At the bottom, there are 'Query results operations' including 'Print', 'Copy to clipboard', 'Export', 'Display chart', and 'Create view'.

Conclusion

In this fast world people are so busy with their work and they don't want to waste time to book tickets offline, which is very stressful and time consuming and to overcome this problem we have made a Travel booking website.

Our travel booking website is very user friendly and easy to use

It requires only few information to book tickets from our website for travelling.

In conclusion a successful project was built in which user can book packages.
